MEDICAL RECORD DEFRAGMENTER

Our company places tremendous value and priority upon the quality of healthcare provided to all American beneficiaries. I would like to discuss briefly below the R&D that was designed and implemented over 25 years as a way to improve the quality of care and reduce costs.   We have designed a mechanism that provides a web-based application integrating all Electronic Medical Records [EMR] systems into a user friendly front-end for all healthcare providers from a real-time data mining repository. In essence, this would furnish all the information that a healthcare provider would utilize while treating a particular patient in any healthcare setting.

In order to better serve all health care beneficiaries, we need a standardized healthcare delivery system. Cost savings by optimized instantaneous communications of integrated health care from all participating providers are the functions of our Universal Medical Record™ [Patents Pending]. UMR adds value with a full spectrum of medical management intelligence by integrating the current state of the art EMR infrastructure.   Patient safety and case management through HIPPA compliance is continuously available to the patient, insurance provider and all health care vendors via a common web-based patient-centric record. We provide a standardized healthcare view to rural and urban sites for predictive modeling costs to reduce the medical GNP.

Thank you.

Steven Charles Cohn, M.D.
